"Construction of DNA sequences complementary to rat alpha 1 and alpha "Construction of DNA sequences complementary to rat alpha 1 and alpha 2 collagen mRNA and their use in studying the regulation of type I collagen synthesis by 1,25-dihydroxyvitamin D.";
Biochemistry 31:6210-6216(1984).
-!- FUNCTION: Type I collagen is a member of group I collagen (fibrillar forming collagen).
-!- SUBNNIT: Trimers of one alpha 2(I) and two alpha 1(I) chains.
-!- TISSUB SERCIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           chains.
-!- PTM: O-linked glycan consists of a Glc-Gal disaccharide bound to the oxygen atom of a post-translationally added hydroxyl group.
-!- SIMILARITY: Belongs to the fibrillar collagen family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GPP-----GEPGPTGLPGPPGERGGPGSRGPPGADGVAGPKGPAGERGSPGPA

FUNCTION: Type I collagen is a member of group I collagen (fibrillar forming collagen).
SUBUNIT: Trimers of one alpha 2(I) and two alpha 1(I) chains.
TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Triple-helical region.
Nonhelical region (C-terminal).

"Nucleotide sequence of a collagen cDNA-fragment coding for the carboxyl end of pro alpha 1(I)-chains.";
FEBS Lett. 111:61-65(180).
-- FUNCTION: Type I collagen is a member of group I collagen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (fibrillar forming collagen).
--- SUBUNIT: Trimers of one alpha 2(I) and two alpha 1(I) chains.
--- TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!- PTM: Proline residues at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains. Pro-1153 is the only 3-hydroxypro and the only hydroxylated proline in position X.
-!- SIMILARITY: Belongs to the fibrillar collagen family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Collagen; Direct protein sequencing; Extracellular matrix; Glycoprotein; Hydroxylation; Pyrrolidone carboxylic acid; Repeat; Signal; Structural protein.

Bouwstra JB, Toda Y;

WPI; 2004-229415/22.

Composition useful as substitute for plasma, comprises solution of saline and recombinant gelatin-like protein having colloid osmotic function.

Example 1; SEQ ID NO 2; 31pp; English.

The present sequence is the protein sequence of recombinant gelatin-like protein Hu-3. This is a trimer of human recombinant gelatin-like protein Hu-1 App48390. A claimed composition suitable as a substitute for plasma comprises a solution of saline and a protein having a colloid osmotic function. The protein is a recombinant gelatin-like protein with a colloid veight of at least 10 kDa and at most 50 kDa and an isoelectric point of less than 8. It is especially Hu-1 or Hu-deam ADM48393. The recombinant gelatin-like protein, or a dimer, trimer or tetramer of the protein, is useful as a plasma expander that has a lower clearance rate from blood circulation, provides better and predictable regulation of clearance rate and which is less susceptible to proteolytic degradation than presently used gelatin derivatives. Recombinant gelatin-like proteins that are in essence free of thydroxyproline do not give rise to an immunological reaction with blood samples containing IgE antibodies. The gelatin-like proteins can be covalently attached to pharmaceutically

culturing anchorage dependent with gelatine or gelatine-like

Preparing cell culture support useful for cells, involves coating microcarrier bead protein having specific molecular weight.

WPI; 2004-507711/48.

active compounds. After administration, the coupled medicament will not diffuse from the circulating blood into the interstitium. Clearance by liver and kidney will be kept to a minimum, ensuring a more constant plasma level of the medicament. Suitable medicaments include those involved in intervening blood clotting, vasodilation, function of erythrocytes, thrombocytes and leukocytes, immune responses, and blood levels of messenger molecules such as hormones.

The present sequence is the protein sequence of human recombinant gelatin to the present sequence is the protein sequence of human recombinant gelatin the polypeptide Hu-3, which has a molecular weight of approximately 54 the and which contains multiple Gly-Xaa-Yaa triplets. In an axample from using a heterobifunctional crosslinking agent, and used in a spinner crosslinking agent, and used in a spinner from the preparation of a cell culture support comprises the step of coating a microcarrier bad with collatine or gelatine like protein having a molecular weight of about 40-200 kba, and optionally further comprising the step of immobilising the core than 75%, preferably more than 85% and more preferably more than 95% of the gelatine or gelatine-like protein on the microcarrier. In this process, of the gelatine or gelatine-like protein is recombinantly produced to obtain a material of uniform molecular weight and to reduce the risk of contamination with prions. A claimed cell support consisting of at a material of uniform molecular weight and to reduce the risk of contamination with prions. A claimed cell support consisting of at residues and less than 5% of hydroxyproline residues, with a molecular cesidues and less than 5% of hydroxyproline residues, with a molecular sight distribution showing a maximum between 40 and 200 kba, at least maximum. Large-scale production of expressed products can be accomplished with gelatine-coated microcarriers.

                                                                                                                                                                                                                            ∙ &
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is the protein sequence of recombinant gelatin-like protein Hu-1 Anh48390. A claimed composition suitable as a substitute for plasma comprises a solution of aline and a protein having a colloid commotic function. The protein is a recombinant gelatin-like protein with a molecular weight of at least 10 kDa and at most 50 kDa and an ciscolectric point of less than 8. It is especially Hu-1 or Hu-deam ADM48393. The recombinant gelatin-like protein, or a dimer, trimer or tetramer of the protein, is useful as a plasma expander that has a lower clearance rate from Blood circulation, provides better and predictable regulation of clearance rate and which is less susceptible to proteolytic degradation than presently used gelatin derivatives. Recombinant gelatin-compounds that are in essence free of hydroxyproline do not give rise to an immunological reaction with blood semples containing 1gE antibodies. The gelatin-like proteins can be covalently attached to pharmaceutically active compounds. After administration, the coupled medicament will not diffuse from the circulating blood into the minimum, clearance by liver and kidney will be kept to a minimum, ensuring a more constant plasma level of the medicament.                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                             matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-coll with a hypertonic growth medium containing at least one assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the cecombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional fibronectin whose ability to self aggregate and produce functional constant sequence represents human collagen (raphal) helical region, which may be produced using the method of the invention

Peptides derived from the protien were used to demonstrate incorporation of 3,4-dehydro-L-prolline into the peptide, using the method of the invention. The specification describes a method for the incorporation of non-natural amino acid into a polypeptide. The method comprises reacting at least one 3,4-dehydroprolline residue in the polypeptide with an epoxidation reagent from a polypeptide containing at least one 3,4-

epoxyproline residue. The method is used for studying the effects of non-
natural amino acids on structure and function of polypeptides. The method
is also useful for commercial production of collagen or mussel adhesive
proteins (which are useful as bioadhesives), and for incorporating a wide
variety of groups, including therapeutic ligands and biological probes,

matrix protein describes a method top producing an extractionary and extractionary and extractionary and extractionary and extractionary and extractionary and protein is capable of self aggregating in a cell which does not ordinarily exportantly according to the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated into the cells and incorporated into the extracellular matrix protein. The method may be used to make host calls assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the cembral production of proteins such as collagen, fibringson and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of proline. The proteins equence represents a chimaric collagen, flathall/decorin protein, which may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                297 GPPGPAGEEGKRGARGEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA 356

The specification describes a method for producing an extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-cydroxyproline to allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional contents also useful in studying the structure and function of proteins content sequence represents chimeric collagen (alphal)/transforming proteins content and content content and conte

The invention relates to the production of mammalian collagen in plants.

2 clones: alpha3 and alpha22, spanning the human collagen type I gene
were isolated from a MG-63 osteosarcoma library. Clone alpha3 contained
83 bp of the 5' untranslated region and the first 1920 bp of coding
cequence, whereas clone alpha22 contained sequence encoding amino acids
171-145 of the protein and around 500 bp of the 3' untranslated region.
The 2 clones were used to generate a number of fragments which were used
to construct composite sequences encoding variant collagen molecules. The
Exagments are: (A) containing nuclectides (nt) -4 to 479; (B) containing
to receive a signal peptide and bases 66-77 from the sequence encoding the
protein S) signal peptide and bases 66-77 from the sequence encoding the
construct sof the pro-collagen amino propeptide domain; (C) the whole of
the amino propeptide domain (nt 72-479); (B) all of the halicoidal region (nt 535construct sof the central helicoidal domain; (F) the BamHI-EccRI (2803-4362)
region of alpha22, encoding as 936-1192 in the central helicoidal domain
and as 1193-1454 in the C-propeptide domain; (G) the C-terminus of the Ccorpoptide domain (as 1346-1464) plus stop codons, and (H) as G but
concoling as 1343-1401 and also including the KBCE motif for retention in
the ER. This sequence represents a recombinant human collagen. The
encoding gene was constructed from fragments (A), (D), (E), (F) and (G).
The recombinant gene is used for expression of mammalian collagen.
Company of the paransformed planes, their extracts and parts are useful
as biomaterials (haemostatic compresses, sponges or bandages) and in
comment of the contral planes or bandages and in
comment of the contral compresses, sponges or bandages) and in
comment of the contral compresses, sponges or bandages) and in
comment of the contral compresses, sponges or bandages) and in compositions (e.g. as prostheses for cardiac valves, ligaments or tendons is kin substitutes; gingival implants; microcapsules for perfumes; guide tubes for nerve regeneration; slow release products for antibiotics, growth factors, anticancer agents or anti-inflammatories; surgical thread and components of ointments). They are suitable for treating any disorder related to collagen dysfunction and gelatin, produced from collagen, is used to produce glues, surgical prostheses and foods 637 517 108 GVMGFPGPKGAAGEPGKAGERGVPGPPGAVGPAGKDGEAGAQGPPGPAGPAGERGEQGPA 168 697 757 GE----AGRPGEAGLPGAK-----GLTGSPGSPGPDGKTGPPGPAGQDGRP 300 577 GADGQPGAKGEPGDAGAKGDAGPPGPAGPPGPIGNVGAPGAKGAKGARGSAGPPGATGFP 877 GAAGRVGPPGPSGNAGPPGPPGPAGKEGGKGPRGETGPAGRPGEVGPPGPPGPAGEKGSP 937 394 GEQGVPGDLGAPGPSGPAGEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSP 453 48 GPPGPAGEEGKRGARGEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA GVMGFPGPKGAAGEPGKAGERGVPGPPGAVGPAGKDGEAGAQGPPGPAGPAGERGEGGGPA GSPGFQGLPGPAGPPGEAGKPGEQGVPGDLGAPGPSGPAGE-----PGP----------TGLPGPPGERGCPGSRGFPGADGVAGPKGPAGERGSPGPAGPKGSP GPKGSPGEAGRPGEAGLPGAKGLTGSPGSPGPDGKTGPPGPAGQDGRPGPPGPPGARGQA GPKGSPGEAGRPGEAGLPGARGLTGSPGSPGFDGKTGPPGPAGQDGRPGPPGPPGARGQA ----VGPAGKDGEAGAQGPPGPAGP---AGERGEQGPAGSPGFQGLPGPAGPPGEAGKP GPP-----GEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPA ----AGVMGFPGPKGAAGEPGKAGERGVPGPPGA----Gaps 64.1%; Score 2237.5; DB 2; Length 1464; 60.2%; Pred. method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (Ct) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at fip.wipo.int/pub/published_pct_sequences.

Sequence 1464 AA;

```
The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleide acid sequence. Also comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the eactivity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying a nucleotide sequence that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence the expression of a polynucleotide sequence which is differentially expression of a polynucleotide or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polyneptides or their antiboddes. The polynucleotide or the compound that of pain as activity is useful for preparing a medicament for treating pain (e.g. spinal sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note:

The sequence data for this patent did not form part of the printed for it is a print of the specification but was obtained an electronic form directly from WIPO at the print of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

                                                                                                                                                                                                                                                                                                                                                                                                 The invention discisses a composition comprising two or more isolated rate or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a compound that is differentially expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal compound that regulates the expression of the polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polymucleotides, a method for identifying a compound useful in treating method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polympiciation, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more completes its activity is useful for preparing a medicament for treating pain and e.g. spinal segmental nerve injury (Cur) and spared nerve injury (Sur) in an animal (e.g. gene complete that patent did not from protein (shown in Table 2 of the sequence data for this patent did not form part of the printed composition, but was obtained in electronic form directly from WIPO at the sequence of the sequen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              212
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GPKGSPGEAGRPGEAGLPGAKGLTGSPGSPGPDGKTGPPGPAGQDGRPGPPGARGQA 108

tissues useful to prevent/treat an abdominal aortic aneurysm or rupture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a T-lymphocyte derived from abdominal aortic tissue whic are specifically reactive with collagen I, collagen III or their fragments. The invention is useful to prevent or treat an abdominal aortic aneurysm (AAA) or rupture in a mammal. The present sequence is human collagen I alphal (I) chain protein. This sequence is used in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   48
Isolated or purified lymphocytes derived from blood in abdominal aortic aneurysm patients useful for early diagnosis of aneurysms are reactive with collagen I, collagen III and/or their fragments.
                                                                                                                                                                                         The present provides a T-lymphocyte derived from blood in abdominal aortic aneurysm (AAA) patients which are reactive with collagen I, collagen III and their fragments. The invention is useful in diagnosis, prevention and treatment of abdominal aortic aneurysm or rupture in a mammal. The invention is also useful in the vaccine preparation. The present sequence is human collagen I alphal (I) chain protein.

The method comprises comparing the level of cancer in a patient. The method comprises comparing the level of from the patient with that in a normal patient sample, where a difference in the gene expression in the first sample compared to that in the second distinguishing between normal and disease. Also claimed are: method (M2) for canticoring the response of a breast cancer patient to treatment with an conticoring the response of a breast cancer patient to treatment with an inticancer agent, method (M4) for identifying a compound for treating conticoring two or more probes corresponding to genes selected from ADR99122-ADR99121 or comprising two or more probes corresponding to genes selected from ADR99122-ADR99121 and the gene products are polypeptides selected from ADR99122 and the gene products are polypeptides selected from ADR99122 or comparising two or more probes cancer. M2 and the array are comparising the response of a breast cancer. M2 and the array are comparising the response of a breast cancer patient to treatment with a DAR99248. M1 is useful for diagnosing breast cancer. M2 and the array are comparising the response of a breast cancer patient to treatment with the can anti-cancer agent. M4 is useful for identifying a compound for treating breast cancer. Note: The sequence data for this patent did not command and patient of the printed specification, but was obtained in electronic comparison.

The present sequence is porcine alphal(I) collagen. The present invention relates to recombinant synthesis of collagens and gelatins derived from animals. Collagen is useful in medical, pharmaceutical, food and cosmetic industries. Collagen is an important component of arterial sealants, bone grafts, drug delivery system, dermal implants, haemostats, and in commence implants, and for treating autoimmune disorders such as rheumatoid arthritis. Collagen is useful in food products such as sausage casings, and in cosmetics or facial and skin products such as sausage casings, and in cosmetics or facial and skin products such as constitution in the manufacture or as a component of various pharmaceutical and treating viral infections, autoimmune diseases and cancer. Gelatin is useful in the manufacture or as a component of various pharmaceutical and care and skin care products, in food and beverage industries, in hair care and skin care products, as a light-sensitive coating in various manufacturing and photographic applications, in laboratory application, and as a component in various gels used for biochemical and electrophoretic analysis, including enzymographic gels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          531

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 21, A

Patent No. 623314
GENERAL INFORMATION:
APPLICANT: Qvist, Per
APPLICANT: With Bonde, Martin
TITLE OF INVENTION: A Method for Assaying Collagen Fragments
TITLE OF INVENTION: Method and Use of the Method to Diagnose the Presence of TITLE OF INVENTION: Method and Use of the Method to Diagnose the Presence of NUMBER OF SEQUENCES: 21.
